

Preference for Information and Dynamic Consistency

Simon Grant

Atushi Kajii

Ben Polak

We provide necessary and sufficient conditions for a dynamically consistent agent always to prefer more informative signals (in single-agent problems). These conditions do not imply recursivity, reduction or independence. We provide a simple definition of dynamically consistent behaviour and we discuss whether an intrinsic information lover (say and anxious person) is likely to be dynamically consistent.

Keywords: information, non-expected utility, dynamic consistency, randomization, anxiety.
